

ThermoFlow

Thermo-hydraulic Modelling and
Development of a Modelica Standard Library

by
Jonas Eborn
Falko Wagner
Hubertus Tummescheit

Contents

- Introduction
 - Applications
 - Simulation software
- Physical Modelling
- ThermoFlow model library
- Library design considerations
- Modelica constructs
- Examples
- Conclusions

March 2, 2000

Jonas Eborn & Falko Jens Wagner

2

Introduction

- Thermodynamics
 - large field, “mother of science”
 - well-founded theory (first & second law)
 - empirical knowledge for materials & machines
 - expert: years of experience
 - model libraries can aide the non-expert with system simulation

March 2, 2000

Jonas Eborn & Falko Jens Wagner

3

Introduction - Applications

- Power (thermal, nuclear, solar ...)
- Refrigeration
- Chemical processes
- Building heating & ventilation
- ... many more ...

March 2, 2000

Jonas Eborn & Falko Jens Wagner

4

Introduction - Software

- Specialized thermo-hydraulic software
 - SINDA/FLUINT
- Static design tools
 - ProSim (power plants etc.)
 - Aspen Tech. (chemical process design)
- Computational Fluid Dynamics, CFD
 - FEMLAB, Combustion & 3D flow models
- General simulation packages
 - Dymola

March 2, 2000

Jonas Eborn & Falko Jens Wagner

5

Contents

- Introduction
- Physical Modelling
 - Balance equations
 - Constitutive relations
- ThermoFlow model library
- Library design considerations
- Modelica constructs
- Examples
- Conclusions

March 2, 2000

Jonas Eborn & Falko Jens Wagner

6

Physical Modelling - Features

- State of pure fluid described by 2 variables
 - p, ρ, v, T, u, h and s are possible
 - choice affects numerical properties
 - impossible combinations, e.g. $\{p, T\}$
- Balance eqns in mass, energy and momentum
- Constitutive relations
- Medium property models, functions of state

March 2, 2000

Jonas Eborn & Falko Jens Wagner

7

Physical modelling - Balances

Euler view: Integrate partial diffs. over a finite control volume

- Mass balance

$$\frac{d\rho V}{dt} = \frac{dm}{dt} = \sum_i \dot{m}_i$$

- Energy balance

$$\frac{dE}{dt} = \dot{Q} + \dot{W}_s + \sum_i \left(\dot{m}_i h_i + \frac{v_i^2}{2} + gz_i \right)$$

- Momentum balance

$$V \frac{d\rho v}{dt} = l \frac{d\dot{m}}{dt} = (G_A - G_B) + A(\Delta p - \Delta p_f)$$

March 2, 2000

Jonas Eborn & Falko Jens Wagner

8

Physical modelling - State eqn

Rewrite basic balances into state eqns. for increased efficiency

- State equations in pressure and enthalpy:

$$\frac{dp}{dt} = \frac{\rho}{\alpha_p \rho + \alpha_v} \left(\left(\frac{\rho + \alpha_h h}{\rho V} \right) \Delta m - \frac{\alpha_h}{\rho V} \Delta e \right) \quad \Delta m = \sum_i \dot{m}_i$$

$$\frac{dh}{dt} = \frac{\rho}{\alpha_p \rho + \alpha_v} \left(\left(\frac{\rho - \alpha_p h}{\rho V} \right) \Delta m - \frac{\alpha_p}{\rho V} \Delta e \right) \quad \Delta e = \sum_i \dot{m}_i h_i + \sum_j \dot{q}_j$$

ρ , α_p , α_h and T are calculated by property functions.
Similar structure has been derived for (p, s) and (ρ, T) .

March 2, 2000

Jonas Eborn & Falko Jens Wagner

9

Physical modelling - Empirics

Constitutive relations for different units are found by empirics,
Dimension free numbers used: Re , Pr , Nu , Fr , ...

- Pressure drop correlations

$$\Delta p_f = f(Re, l, d) \frac{l}{d} \frac{\dot{m}}{\rho A}$$

- Heat flow correlations

$$\dot{q} = h(Re, Pr, \dot{m}) A \Delta T$$

- Unit specific characteristics

March 2, 2000

Jonas Eborn & Falko Jens Wagner

10

Physical modelling - Medium

- Medium properties are calculated from functions
 - Water (thermal power plants, steam heating)
 - Refrigerants (cooling in industry, ventilation...)
 - Gas mixtures (ideal or non-ideal, combustion)

Implemented as look-up tables or by approximation functions.
Iterative solutions \rightarrow too slow for dynamic simulation.
Forward expressions in state give fast evaluation.

March 2, 2000

Jonas Eborn & Falko Jens Wagner

11

Physical modelling - Medium

- Steam properties standard: IAPWS-IF97
 - explicit functions in p , h
 - 5 different regions, switching

March 2, 2000

Jonas Eborn & Falko Jens Wagner

12

Contents

- Introduction
- Physical Modelling

- Conclusions

March 2, 2000

Jonas Eborn & Falko Jens Wagner

13

ThermoFlow - Library goals

- User-friendly, for basic/advanced users
- Cover wide area of interest
- Unified component library
 - lumped and discretized models
- Flexibility through parameterization

March 2, 2000

Jonas Eborn & Falko Jens Wagner

14

ThermoFlow - Applicability

- Many different media, water, gas, refrigerant
 - also multi-component mixtures
- Handle all cases of flows
 - uni- or bidirectional
 - one- or two-phase
 - homogeneous or inhomogeneous
 - with/without dynamic momentum balance
- Units: valves, heat exchangers, turbines, ...

March 2, 2000

Jonas Eborn & Falko Jens Wagner

15

ThermoFlow - Flexibility

- Use parameters for choosing
 - level of discretization
 - medium type, class parameters
 - if dynamic or static flow is used
- Empty “shell” models allow the user to create new compatible models

March 2, 2000

Jonas Eborn & Falko Jens Wagner

16

Contents

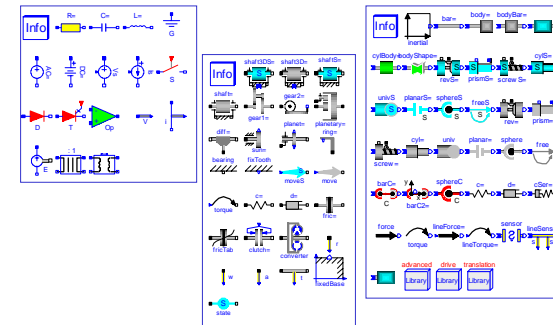

- Introduction
- Physical Modelling
- ThermoFlow model library
- Library design considerations
 - decomposition
 - library structure
- Modelica constructs
- Examples
- Conclusions

March 2, 2000

Jonas Eborn & Falko Jens Wagner

17

Existing Libraries

March 2, 2000

Jonas Eborn & Falko Jens Wagner

18

New Library

March 2, 2000

Jonas Eborn & Falko Jens Wagner

19

What do we want to model?

- Power plants
- Refrigeration systems
- Component examples :
 - compressors, turbines, condensers, heat exchangers, boilers, flow in pipes, valves, etc.

March 2, 2000

Jonas Eborn & Falko Jens Wagner

20

Example : Power Plant

March 2, 2000

Jonas Eborn & Falko Jens Wagner

21

Hierarchical decomposition

March 2, 2000

Jonas Eborn & Falko Jens Wagner

22

Component models

Power plant

March 2, 2000

Jonas Eborn & Falko Jens Wagner

23

The power plant

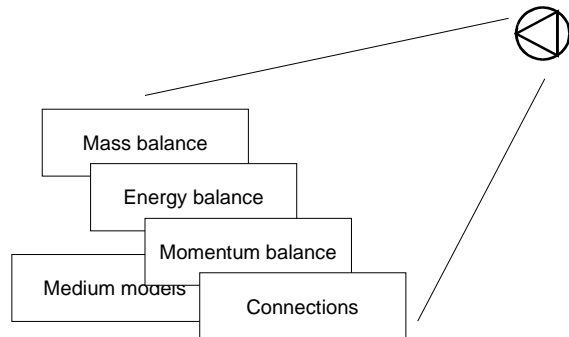

March 2, 2000

Jonas Eborn & Falko Jens Wagner

24

The pump

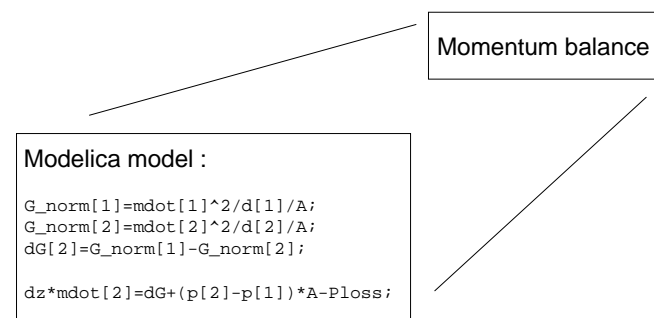

March 2, 2000

Jonas Eborn & Falko Jens Wagner

25

The momentum balance

```

Modelica model :
G_norm[1]=mdot[1]^2/d[1]/A;
G_norm[2]=mdot[2]^2/d[2]/A;
dG[2]=G_norm[1]-G_norm[2];

dz*mdot[2]=dG+(p[2]-p[1])*A-Ploss;
    
```

March 2, 2000

Jonas Eborn & Falko Jens Wagner

26

The connections

```

connector SingleFlow
  SIunits.Pressure      p;
  SIunits.SpecificEnthalpy h;
  flow SIunits.MassFlowRate mdot;
  flow SIunits.Power    q_conv;
  SIunits.Density       d;
end SingleFlow;

model pump
  SingleFlow in,out;
end model pump;

model boiler
  SingleFlow in,out;
end model boiler;

connect(pump.out,boiler.in);
    
```

March 2, 2000

Jonas Eborn & Falko Jens Wagner

27

Important aspects

- Level of details
 - Purpose of library vs. modeling principles
- Nomenclature of research field
 - Use of known symbols/formulations
- Do not overkill !
 - Just because something seems to be general, it doesn't need its own class.

March 2, 2000

Jonas Eborn & Falko Jens Wagner

28

Key elements in library (1)

- Interfaces
 - all components have same interfaces (or same class of interfaces)
- Base components
 - build new components from basic
 - shell components (e.g. TwoPort)
- Advanced components

March 2, 2000

Jonas Eborn & Falko Jens Wagner

29

Key elements in library (2)

- Media property routines
 - fast! => for dynamic simulation
 - fast means explicit in state variables
 - fast means also pure Modelica functions
 - due to symbolic manipulation capabilities

March 2, 2000

Jonas Eborn & Falko Jens Wagner

30

Library structure

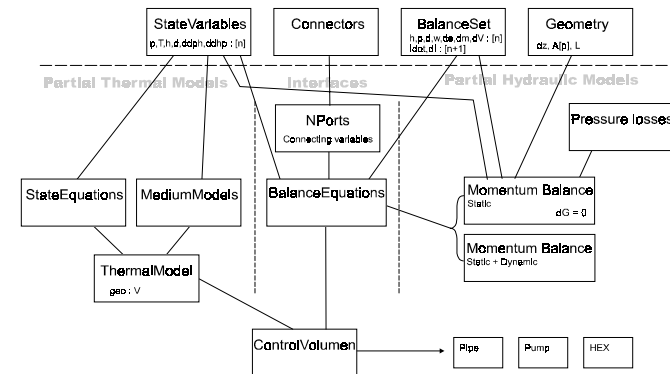

- Classes :
 - Interfaces (connectors, variable sets)
 - n-Ports (contain connectors)
 - State equations
 - Media property routines
 - Thermal model (state equations + media)
 - Balance equations (mass + energy)
 - Hydraulic model (momentum + pressure)
 - Geometry data

March 2, 2000

Jonas Eborn & Falko Jens Wagner

31

Class diagram

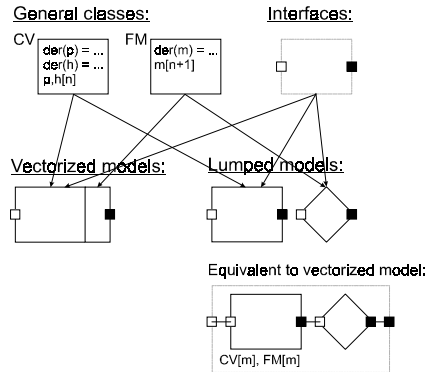

March 2, 2000

Jonas Eborn & Falko Jens Wagner

32

Details

March 2, 2000

Jonas Eborn & Falko Jens Wagner

33

Interfaces

- Connectors contain:
 - $p, h, \text{mdot}, q_{\text{conv}}, d, G_{\text{norm}}, dG$
 - replaceable elements:
 - γ, T
 - mdot for multiflow
- n-Ports
 - OnePort, TwoPort, ThreePort

March 2, 2000

Jonas Eborn & Falko Jens Wagner

34

Contents

- Introduction
- Physical Modelling
- ThermoFlow model library
- Library design considerations
- [Modelica constructs](#)
 - class parameterization
 - n-discretization
- Examples
- Conclusions

March 2, 2000

Jonas Eborn & Falko Jens Wagner

35

Class parameterization

- Used to implement alternate/exchangeable
 - Connectors
 - Media properties
 - Momentum balances
- Construct:

```
replaceable model Exchangeable=DefaultClass;  
extends Exchangeable;
```

March 2, 2000

Jonas Eborn & Falko Jens Wagner

36

Example

Class parameterization of connectors:

```
connector GExtension
  flow MomentumFlow G_norm;
  flow MomentumFlow dG;

connector SingleFlow
  Pressure p;
  SpecificEnthalpy h;
  flow MassFlowRate mdot;
  flow Power q_conv;
  Density d;
  replaceable model ConnectorExtension = GExtension ;
  extends ConnectorExtension;

SingleFlow a(redeclare model ConnectorExtension= GExtension);
```

March 2, 2000

Jonas Eborn & Falko Jens Wagner

37

Generic n-discretization

- Classes are discretized to contain n control volumes
- Possibility for using higher order derivatives
 - easier access to neighboring control volume

```
for i in 1:n loop
  dm[i]=mdot[i]-mdot[i+1];
  de[i]=edot[i]-edot[i+1]-p[i]*dV[i]+q_source[i];
end for;
```

March 2, 2000

Jonas Eborn & Falko Jens Wagner

38

Switching terms

- Switches used in momentum balances
 - big “IF” construction
- Generally done to support bi-directional flow

```
G_norm[i] = if mdot[i] > 0 then
  mdot[i]*mdot[i]/d[i-1]/A
else
  mdot[i]*mdot[i]/d[i]/A;
```

March 2, 2000

Jonas Eborn & Falko Jens Wagner

39

Library implementation

- Sub tree
 - /library/Modelica/ThermoFlow
 - results in “dot” notation : Modelica.ThermoFlow
- Top level contains
 - package.mo (description of library)
 - Interfaces.mo
 - PartialThermalModels.mo
 - PartialHydraulicModels.mo

March 2, 2000

44

Conclusions

- Modelica supports library development
- Modelica constructs used to
 - increase flexibility
 - reduce number of component variants
 - choose complexity level
- Wide area of applicability with different medium models
